ABSTRACT

In accordance with an embodiment of the present intention, a fluorine residue removing method includes: supplying an oxygen-containing gas and a hydrogencontaining gas into a CVD chamber; producing a plasma of a mixture of the oxygen-containing gas and the-hydrogen containing gas, so that the plasma reacts with the fluorine residue, exothermically generating water; and evacuating from the CVD chamber a product of the reaction between the plasma and the fluorine residue. For the hydrogen-containing gas, NH₃ is often used, and for the oxygen-containing gas, N_2O , O_2 , or air is used. Exemplary mixtures of the oxygen-containing and the hydrogen-containing gases include 70 mol % N_2O/NH_3 , 50 mol % N_2O/NH_3 , and 52 mol % O_2/NH_3 . An inert gas, such as He, Ne, Ar, or Kr, can be optionally supplied into the chamber to stabilize the plasma.
